

# Jordan Lee

+1 (555) 010-2468 | jordan.lee@example.com | example.com/code/jordan-lee

Age: 26 | Marital status: Single | Hobbies: watching TV, sleeping in

## EDUCATION

Western State University | M.S. in Computer Engineering | Metro City, USA | Sep 2024 - Expected Jun 2026

Eastern Institute of Technology | B.S. in Electrical Engineering | Metro City, Country | Sep 2018 - Jun 2022

## EXPERIENCE

Eastern Robotics Co. | Junior Software Engineer | Metro City, Country | Oct 2023 - Jul 2024

- Responsible for the monitoring dashboards of the diagnostics service and for supporting the on-call team with weekly reports.
- I worked on improving the latency of our API and I also wrote tests for it, which I think made the service a lot faster for users.
- Maintained the CI pipeline for the perception team's model releases, adding automated regression checks that shortened release cycles from 2 weeks to 3 days.
- Migrated 30 robot-fleet services from cron jobs to an event queue with retries and dead-letter handling, removing the nightly backlogs that delayed morning dispatch.

Mobility Systems Company | Machine Learning Engineering Intern | Metro City, USA | Oct 2024 - May 2025

- Built a diagnostics triage branch for an industrial inspection system that screens 800+ sensor signals per case with ML-extracted features, cutting the pending-case backlog 68% in the first quarter after launch.
- Improved model performance by 35% by fine-tuning a domain adapter on validated tool-use trajectories with assistant-only loss masking.
- Designed a routing layer that limits each of 3 specialist agents and an independent reviewer to their in-scope signals, keeping every finding traceable to its source data.
- Applied GRPO with grouped tool-use rollouts and a composite reward, cutting end-to-end latency 5% versus the SFT baseline with no loss in diagnostic accuracy.
- Single-handedly built the company's entire ML platform, which is now used by every team across engineering, operations and research.
- Documented the triage branch's abstention rules and escalation paths for the on-call reviewers, who adopted them as the team's runbook.

## PROJECTS

Agent Runtime Suite | Owner | TypeScript, Multi-Agent Systems | Aug 2025 - Present

- Leveraged cutting-edge AI synergies and next-generation agentic paradigms to drive innovation and unlock value across the organization.
- Kept working context under 10K tokens across a 100-turn stress test while the raw conversation grew 100x, using budgeted context layers and staged compaction.
- Led the Project Falcon migration to NGX on the KRT stack, coordinating the cutover of the Orion and Vega pipelines.

Research-Agent Evaluation Framework | Contributor | LLM Evaluation | Feb 2025 - Jul 2025

- Upstreamed 8 citation and faithfulness metrics to an open-source research-agent framework, where they now run in the default benchmark for every release.
- Was involved in the process of helping to support the evaluation of the reports that were being produced by the pipeline at the time.
- Traced 3 structural pipeline defects in stability, sourcing and parameter handling to their modules with layered instrumentation; each was fixed upstream.

## SKILLS

Programming: Python, TypeScript, SQL, Bash, Git

ML & Agents: PyTorch, LoRA, GRPO, LangGraph, RAG, agent evaluation
